

Amendments to the Specification:

Please amend the specification as follows by replacing the identified paragraph with the following corresponding amended paragraph. Applicant finds support for the amendment from the numerical identification 420 of the recognizable center mark in FIGS. 1 and 4 and similar references thereto in paragraphs 0059 and 0061.

[0051] The media handle / speed browser **320** will typically have a center mark ~~322~~**420** for indicating a center point of the media handle / speed browser. When the media handle is in a rest position, typically a centerline position, the center mark will point to an associated time unit **330** within the time bar **310**. This associated time unit will be indicated on the media handle and either the media view or the calendar view associated with the time unit will generally underlie the center mark. When the media handle is in a deviated position, the center mark will point to an associated time unit within the time bar and the media view or calendar view associated with that time unit will be presently scrolling in the viewable display.
